Document control. This dossier was generated programmatically by Project ARGUS from the telecom records loaded into the named case under reference **ARGUS-EVD-20260627-005632-5967**, which is recorded in the system audit log (chain of custody). It is an investigative aid and does not by itself constitute proof; all findings should be corroborated with the underlying CDR/IPDR records and primary evidence before being relied upon in proceedings.

APPENDIX A — METHODOLOGY & LIMITATIONS

Findings are derived from Call Detail Records (CDR) and Internet Protocol Detail Records (IPDR) loaded into the named case. CDR and IPDR are analysed under strict separation — a phone-number subject is never merged with an IP subject. Co-location ("meeting") detection infers proximity from same-tower activity within a short time window and is probabilistic, not positional proof. "Impossible travel" flags legs whose implied speed exceeds human possibility and may indicate a cloned SIM or a spoofed record. Cross-case links are an identity/intelligence lookup (number, IMEI handset, IMSI SIM, or IP); IP-only matches are low-confidence because operators reassign addresses. Tower place-names may be approximate where derived by offline reverse-geocoding. All times are shown in the analyst workstation's local timezone. This dossier is an investigative aid; corroborate every finding against the primary records before relying on it in proceedings.
